Google Ads Platform Integration Brief

Objective: Architectural blueprint and marketing framework for building a global multi-tenant automated ad management SaaS platform via the Google Ads API.

1. Core Google Ads Mechanisms & Ecosystem

Google Ads operates on an **Inbound Marketing** infrastructure backed by a real-time instant auction framework. Key parameters include:

- **Pay-Per-Click (PPC) Model:** Advertisers incur a cost-per-click (CPC) only when an end-user performs a click action on the ad asset.
- **Ad Rank Algorithm:** Determined programmatically at runtime using the advertiser's max bid combined with the *Quality Score* (calculated from landing page relevance, historical CTR, and keyword specificity).
- **Account Structure Strategy:** Must utilize a Google Ads Manager Account (MCC) at the parent application layer to provision, manage, and scale independent multi-tenant global child accounts via OAuth 2.0 safely.

2. Analysis of UI Step: Account Linking & Ad Assets

The onboarding workflow screen tracks user-profile configuration extensions (Assets). These elements augment standard ad formats to boost Click-Through-Rate (CTR) and interaction depth:

- **YouTube Channel Association:** Grants permissions to execute programmatic Video Ads, unlocks video-interaction telemetry, and builds retargeting audiences based on active video consumption.
- **Mobile App Integration:** Links application resources directly from Google Play Store or Apple App Store, rendering contextual 'Install' CTA configurations below search snippets.
- **Google Business Profile Linking:** Injects verified location coordinates, physical address snippets, and hours directly into standard search ads and localized Google Maps queries.

3. Sequential API Execution Workflow (Campaign Automation)

Programmatic campaign provisioning requires a deterministic execution chain where children nodes preserve upstream references strictly:

Step	Target API Service	Core Parameters / Actions
1	CampaignBudgetService	Configures strict daily financial thresholds in micros (e.g., $10 = 10,000,000 micros). Returns Budg
2	CampaignService	Binds Budget ID. Defines campaign channel matrix (SEARCH, DISPLAY, VIDEO, or Performance
3	AdGroupService	Injects multi-tiered structural containers underneath the parent Campaign resource to manage key
4	AdGroupCriterionService	Populates contextual triggers. Sets strict Match Types: EXACT, PHRASE, or BROAD to govern re
5	AdGroupAdService	Assembles end-user facing creative payload (Responsive Search Ads requiring 3-15 headlines an

4. Engineering Requirements for Global SaaS Scaling

- **OAuth 2.0 Identity Flow:** Securely capture and persist encrypted user Refresh Tokens in local PostgreSQL/MongoDB layers for persistent backend communication.
- **Developer Token Elevation:** Move from Basic Developer Access to Standard Access tier during the final review to unlock unrestricted global API execution queries.
- **GoogleAdsService (GAQL Querying):** Construct custom SQL-like query streams utilizing Google Ads Query Language to pipe reporting data natively into the custom platform UI.
- **Policy Compliance Layer:** Programmatically sanitize user ad text inputs against Google's legal advertising guidelines to avoid automated application throttling or blacklisting.
